

only one creature has carved a life for itself on every habitat on Earth that creature is us.

all over the world we still use our Ingenuity to survive far from the city lights face-to-face with raw nature.

plants and animals are Nature's Most vigorous complex and mysterious.

they may appear simple but for humans they have the utmost importance.

through history great civilization has used plants and animals in their advantage.

because of plants and animals human civilization has stood the time.

in today's timeline we will take a look at the plant life of one of the most well known urban campus in Ethiopia.

Established in 1993 as Nazareth Technical College.

Students have been going there to excel in both engineering and applied science classes

As we enter through the main gate we see that there are different plant species.

Some for decoration reasons some even are edible plants.

These plants have played a big role in the beauty, suitability and environmental nurturing of the campus.

The campus has 79 different plant species.

Most of the plants are intentionally planted others are wild shrubs.

the plants give an amazing look and key functionality to the whole campus.

The huge trees in the campus have been useful for students to get away from the harsh sun.

Overall we see the campus has done a very good job in nurturing and sustaining the plant life in its own land.
